

# Scripter's Scrapbook

ssbk  
ssBk Plugins

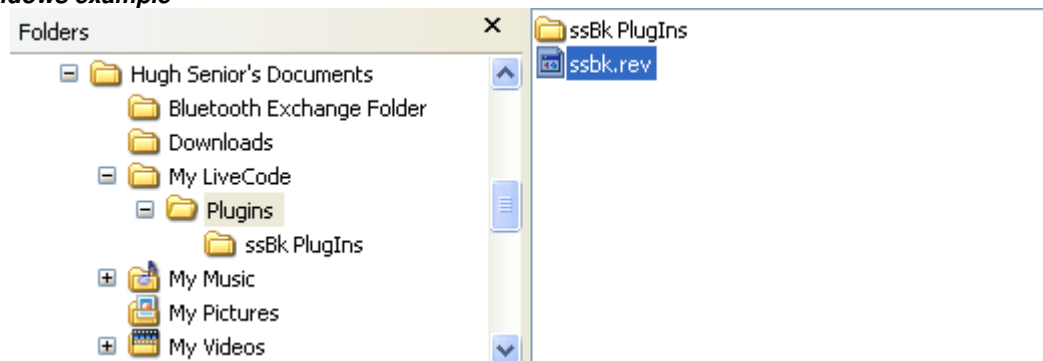

Your scrapbook  
The folder of support resources

## Option 1: Using your Scrapbook as a plugin with LiveCode

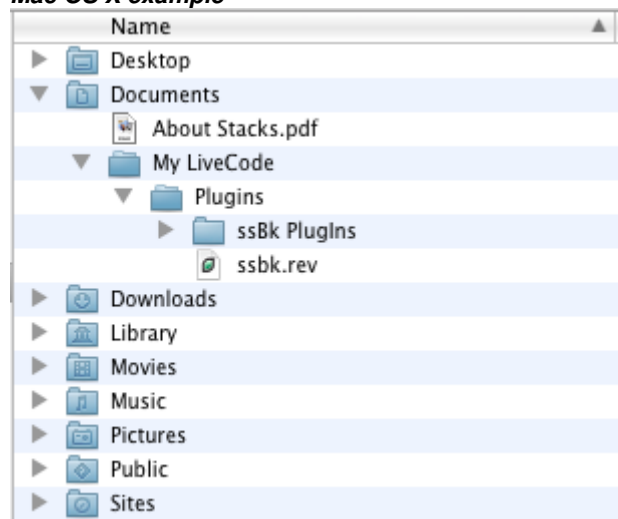

This will display your Scrapbook in LiveCode's plugins menu.

1. On Windows, open "My Documents". On Mac, open your User folder (users/<your name>/Documents).
2. Create a folder called "My LiveCode" if one does not already exist.
3. Inside "My LiveCode" folder, create a folder called "Plugins".
4. Place the download components in the "Plugins" folder and re-start LiveCode. The stacks will be listed under the Development/Plugins sub-menu in the LiveCode menu bar.

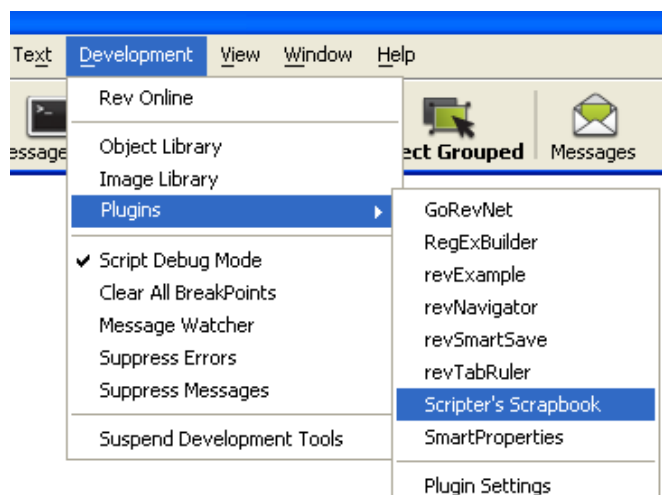

### Windows example

### Mac OS X example

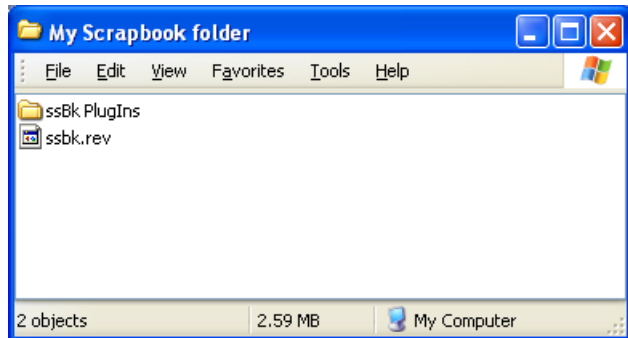

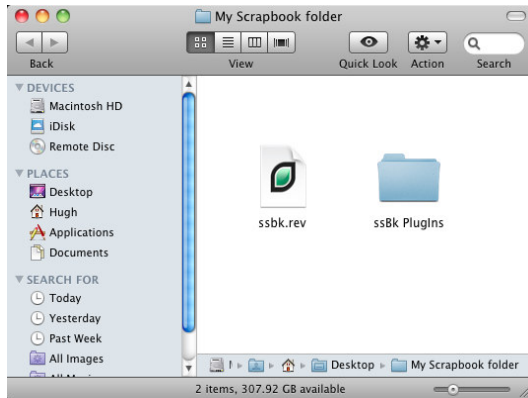

The next time you launch LiveCode, the Development/Plugins menu will display your Scrapbook file...

## Option 2: Using your Scrapbook as an external stack file with LiveCode

If you do want to use your Scrapbook with LiveCode but do not want or need to use it as a plugin, create a folder and place the downloaded ssbk.rev and ssbk Plugins folder together in it. You can store the folder anywhere convenient. Just keep all Scrapbook components together in the same folder.

To open your Scrapbook, use LiveCode's File:Open menu and select ssbk.rev. You can re-name the Scrapbook if you wish to have more than one, but keep them in the same folder.

## Option 3: Using your Scrapbook with a standalone application program

If you prefer to use your Scrapbook independently of LiveCode, download any of the standalone application programs from [www.FlexibleLearning.com/ssbk](http://www.FlexibleLearning.com/ssbk). Create a folder anywhere convenient. Just keep all Scrapbook components together in the same folder.

To open your Scrapbook, launch the application program. It will automatically open ssbk.rev if in the same folder, or ask you to select a Scrapbook if it cannot.

You can re-name the Scrapbook if you wish to have more than one, but keep them in the same folder.

If you have more than one Scrapbook, you can use the Scrapbook preferences to specify which Scrapbook opens by default.
